IPTables

Description

In this project you will write various IP table rules to achieve the desired results. The following should be done on your suricata machine unless otherwise indicated.

- 1. Only allow 144.38.197.10 to access port 80 on that machine. (You should be able to login and verify via a wget)
- 2. Allow all hosts to ssh to that machine except for 144.38.197.10.
- 3. When a request is made to port 8080 on that machine, it should be answered by your client machine on that network (remember that your suricata assignment had the suricata machine and a client).
- 4. When a user tries to ssh to the suricata port 2222, redirect it to your client machine port 22.
- 5. When a user tries to ssh to the suricata port 2223, redirect it to 144.38.192.40 port 22.
- 6. Block outbound pings from your client (Hint: Use the forward chain)

TO pass off

Copy the output of the following commands to a file:

iptables -vL -t filter iptables -vL -t nat
